Identifiability of the Double Heston parameters from one day's NIFTY options (118 sampled test days)

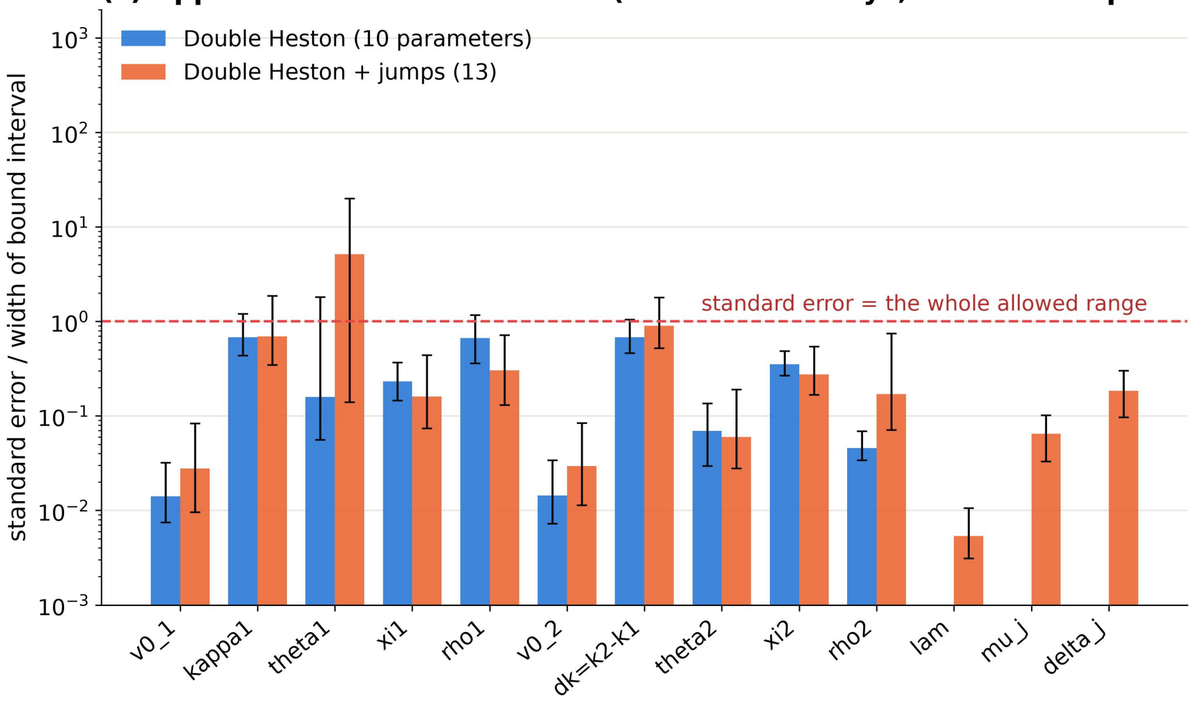

(a) Condition number of the Jacobian at the optimum
(box = quartiles over days, line = median; no day is near-singular)

(b) Days on which the optimum sits on a bound, by parameter
(solid: within 0.3% of the interval width; pale: within 2%)

(c) Approximate standard errors (median over days; whiskers = quartiles)

(d) How many different parameter sets fit equally well
